2. At T-330 K a liquid solution of 0.5 mol fraction of A and 0.5 mol fraction of is in equilibrium with vapor. A and B are miscible and the vapor pressure of the solution is 1 bar. The composition of the vapor is 0.65 mol fraction of A and 0.35 mol fraction of B. What would be the vapor pressures P*A and P*B of the pure components A and B at this temperature?

3. The ratio of a component A to water collected in a steam distillation is 4, when the mixture was boiled at 344 K and 80 kPa. If the vapor pressure of water at this temperature is 43.2 kPa, calculate the molar mass of A (molar mass of water: 18.02 g/mol)

$$\frac{m_{A}}{m_{M_{1}}0} = \frac{n_{A}M_{A}}{n_{H_{2}0}} = \frac{P_{A}^{\times}}{P_{H_{2}0}^{\times}} \frac{M_{A}}{M_{H_{2}0}} \qquad | P - P_{A}^{\times} + P_{H_{2}0}^{\times} \\
= 7 M_{A} = \frac{P_{H_{2}0}^{\times}}{P_{A}^{\times}} \cdot \frac{m_{A}}{m_{H_{2}0}} \cdot M_{H_{2}0} = \frac{P_{H_{2}0}^{\times}}{P - P_{H_{2}0}^{\times}} \frac{m_{A}}{m_{H_{2}0}} \cdot M_{H_{2}0}$$

$$= \frac{43.2}{80 - 43.2} \cdot 4 \cdot 18.02 \frac{9}{mol}$$

$$= 1,1739 \cdot 4 \cdot 18.02 \frac{9}{mol}$$
